## **Advanced/Advanced Subsidiary**

Thursday 7 June 2007 – Morning

Time: 1 hour 30 minutes

 $\frac{\text{Materials required for examination}}{\text{Mathematical Formulae (Green)}} \qquad \frac{\text{Items included with question papers}}{\text{Nil}}$ 

Candidates may use any calculator allowed by the regulations of the Joint Council for Qualifications. Calculators must not have the facility for symbolic algebra manipulation, differentiation and integration, or have retrievable mathematical formulas stored in them.

### **Instructions to Candidates**

In the boxes above, write your centre number, candidate number, your surname, initial(s) and signature.

Check that you have the correct question paper.

You must write your answer to each question in the space following the question.

Whenever a numerical value of g is required, take  $g = 9.8 \text{ m s}^{-2}$ .

When a calculator is used, the answer should be given to an appropriate degree of accuracy.

#### **Information for Candidates**

A booklet 'Mathematical Formulae and Statistical Tables' is provided.

Full marks may be obtained for answers to ALL questions.

The marks for individual questions and the parts of questions are shown in round brackets: e.g. (2).

There are 7 questions in this question paper. The total mark for this paper is 75.

There are 20 pages in this question paper. Any blank pages are indicated.

### **Advice to Candidates**

You must ensure that your answers to parts of questions are clearly labelled. You should show sufficient working to make your methods clear to the Examiner. Answers without working may not gain full credit.

This publication may be reproduced only in accordance with Edexcel Limited copyright policy.

Figure 1

A particle P is attached to one end of a light inextensible string. The other end of the string is attached to a fixed point O. A horizontal force of magnitude 12 N is applied to P. The particle P is in equilibrium with the string taut and OP making an angle of  $20^\circ$  with the downward vertical, as shown in Figure 1.

Find

1.

(a) the tension in the string,

**(3)** 

(b) the weight of P.

**(4)** 

Leave
blank

2.	Two particles $A$ and $B$ , of mass 0.3 kg and $m$ kg respectively, are moving in opposite directions along the same straight horizontal line so that the particles collide directly. Immediately before the collision, the speeds of $A$ and $B$ are $8 \text{ m s}^{-1}$ and $4 \text{ m s}^{-1}$ respectively. In the collision the direction of motion of each particle is reversed and, immediately after the collision, the speed of each particle is $2 \text{ m s}^{-1}$ . Find						
	(a) the magnitude of the impulse exerted by $B$ on $A$ in the collision,	(3)					
		(3)					
	(b) the value of $m$ .	(4)					

A uniform rod AB has length 1.5 m and mass 8 kg. A particle of mass m kg is attached to the rod at B. The rod is supported at the point C, where AC = 0.9 m, and the system is in equilibrium with AB horizontal, as shown in Figure 2.

(a) Show that m = 2.

**(4)** 

A particle of mass 5 kg is now attached to the rod at A and the support is moved from C to a point D of the rod. The system, including both particles, is again in equilibrium with AB horizontal.

(b) Find the distance AD.

4.	A car is moving along a straight horizontal road. At time $t = 0$ , the car passes a point $A$ with speed $25 \mathrm{m  s^{-1}}$ . The car moves with constant speed $25 \mathrm{m  s^{-1}}$ until $t = 10 \mathrm{s}$ . The car then decelerates uniformly for $8 \mathrm{s}$ . At time $t = 18 \mathrm{s}$ , the speed of the car is $V \mathrm{m  s^{-1}}$ and this speed is maintained until the car reaches the point $B$ at time $t = 30 \mathrm{s}$ .
	(a) Sketch, in the space below, a speed–time graph to show the motion of the car from

(a) Sketch, in the space below, a speed–time graph to show the motion of the car from A to B.

**(3)** 

Given that AB = 526 m, find

(b) the value of V,

**(5)** 

(c) the deceleration of the car between t = 10 s and t = 18 s.

**(3)** 

estion 4 continued	

Figure 3

A small ring of mass 0.25 kg is threaded on a fixed rough horizontal rod. The ring is pulled upwards by a light string which makes an angle  $40^{\circ}$  with the horizontal, as shown in Figure 3. The string and the rod are in the same vertical plane. The tension in the string is  $1.2\,\mathrm{N}$  and the coefficient of friction between the ring and the rod is  $\mu$ . Given that the ring is in limiting equilibrium, find

(a) the normal reaction between the ring and the rod,

**(4)** 

(b) the value of  $\mu$ .

**5.** 

**(6)**

6.

Figure 4

Two particles P and Q have mass 0.5 kg and m kg respectively, where m < 0.5. The particles are connected by a light inextensible string which passes over a smooth, fixed pulley. Initially P is 3.15 m above horizontal ground. The particles are released from rest with the string taut and the hanging parts of the string vertical, as shown in Figure 4. After P has been descending for 1.5 s, it strikes the ground. Particle P reaches the ground before Q has reached the pulley.

Q(m kg)

(a) Show that the acceleration of P as it descends is  $2.8 \text{ m s}^{-2}$ .

3.15 m

(3)

(b) Find the tension in the string as *P* descends.

**(3)** 

(c) Show that  $m = \frac{5}{18}$ .

**(4)** 

(d) State how you have used the information that the string is inextensible.

**(1)** 

When P strikes the ground, P does not rebound and the string becomes slack. Particle Q then moves freely under gravity, without reaching the pulley, until the string becomes taut again.

(e) Find the time between the instant when P strikes the ground and the instant when the string becomes taut again.

**(6)**

Question 6 continued	

Leave	
blank	

- 7. A boat B is moving with constant velocity. At noon, B is at the point with position vector  $(3\mathbf{i} 4\mathbf{j})$  km with respect to a fixed origin O. At 1430 on the same day, B is at the point with position vector  $(8\mathbf{i} + 11\mathbf{j})$  km.
  - (a) Find the velocity of B, giving your answer in the form  $p\mathbf{i} + q\mathbf{j}$ .

**(3)** 

At time t hours after noon, the position vector of B is  $\mathbf{b}$  km.

(b) Find, in terms of t, an expression for  $\mathbf{b}$ .

**(3)** 

Another boat C is also moving with constant velocity. The position vector of C,  $\mathbf{c}$  km, at time t hours after noon, is given by

$$c = (-9i + 20j) + t(6i + \lambda j),$$

where  $\lambda$  is a constant. Given that C intercepts B,

(c) find the value of  $\lambda$ ,

**(5)** 

(d) show that, before C intercepts B, the boats are moving with the same speed.
