Tuesday 17 June 2014 –	•	Paper Reference
	Afternoon	Paper Reference 6CH05/01

# **Instructions**

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
  - there may be more space than you need.

# Information

- The total mark for this paper is 90.
- The marks for **each** question are shown in brackets
  - use this as a guide as to how much time to spend on each question.
- Questions labelled with an asterisk (\*) are ones where the quality of your written communication will be assessed
  - you should take particular care with your spelling, punctuation and grammar, as well as the clarity of expression, on these questions.
- A Periodic Table is printed on the back cover of this paper.

# **Advice**

- Read each question carefully before you start to answer it.
- Keep an eye on the time.
- Try to answer every question.
- Check your answers if you have time at the end.

P 4 2 9 7 3 A 0 1 2 8

## **SECTION A**

Answer ALL the questions in this section. You should aim to spend no more than 20 minutes on this section. For each question, select one answer from A to D and put a cross in the box ⊠. If you change your mind, put a line through the box ⋈ and then mark your new answer with a cross ⋈.

1	In whi	ch of the following ions does the metal have an oxidation number of +3?
	⊠ A	MnO <sub>4</sub> <sup>2-</sup>
	⊠ B	VO <sup>2+</sup>
	<b>⊠</b> C	[Fe(CN) <sub>6</sub> ] <sup>4-</sup>
	⊠ D	$[CrCl_2(H_2O)_4]^+$
		(Total for Question 1 = 1 mark)
2	nitrog By cor	er metal is oxidized to Cu <sup>2+</sup> by nitrate(V) ions which are reduced to en monoxide, NO. nsidering the changes to the oxidation numbers of copper and nitrogen, it can duced that in this reaction
	⊠ A	2 mol of copper reacts with 3 mol of nitrate(V) ions.
	<b>В</b>	2 mol of copper reacts with 5 mol of nitrate(V) ions.
		3 mol of copper reacts with 2 mol of nitrate(V) ions.
	■ D	5 mol of copper reacts with 2 mol of nitrate(V) ions.
		(Total for Question 2 = 1 mark)
	Use th	is space for any rough working. Anything you write in this space will gain no credit.

3 The diagram below shows a cell set up between a copper metal / copper(II) ion electrode and a reference electrode, known as a calomel electrode.

Under standard conditions, the emf of this cell was -0.07 V. The standard electrode potential of the copper metal / copper(II) ion electrode is +0.34 V. Hence the standard electrode potential of the calomel electrode is

- B -0.27 V

(Total for Question 3 = 1 mark)

**4** For the reaction

$$2NO_2(g) \rightleftharpoons N_2O_4(g)$$

at 450 K the total entropy change,  $\Delta S_{\text{total}}$  is negative. Hence the equilibrium constant,  $K_{\text{n'}}$  for this reaction at 450 K is

- A zero.
- $oxed{oxed}$  **B** positive and greater than 1.
- **C** positive and less than 1.
- **D** negative.

(Total for Question 4 = 1 mark)

The standard electrode potentials of two half reactions are shown below.

$$\frac{1}{2}CI_{2} + e^{-} \rightleftharpoons CI^{-}$$
  $E^{\ominus} = +1.36 \text{ V}$ 

$$E^{\oplus} = +1.36 \text{ V}$$

$$Co^{3+} + e^{-} \rightleftharpoons Co^{2+} \qquad E^{\ominus} = +1.82 \text{ V}$$

$$E^{\oplus} = +1.82 \text{ V}$$

Which of the following processes is thermodynamically favourable? The reaction of

- A Co<sup>2+</sup> with Cl<sub>2</sub> to form Cl<sup>-</sup>
- **B** Co<sup>2+</sup> with Cl⁻ to form Cl<sub>2</sub>
- C Co<sup>3+</sup> with Cl<sub>2</sub> to form Cl<sup>-</sup>
- **D** Co³+ with Cl⁻ to form Cl₃

(Total for Question 5 = 1 mark)

- A solution of potassium manganate(VII) was used to determine the concentration of iron(II) ions in solution by titration in the presence of excess dilute sulfuric acid.
  - (a) With the potassium manganate(VII) in the burette, the end-point of the reaction is when the solution in the conical flask turns

(1)

- A colourless.
- **B** pink.
- **C** green.
- $\square$  **D** orange.
- (b) If insufficient acid is added, the titre value is

(1)

- A low and a brown precipitate forms.
- **B** low and a green precipitate forms.
- C high and a brown precipitate forms.
- D high and a green precipitate forms.

(Total for Question 6 = 2 marks)

- 7 What is the electronic configuration of the stable scandium ion?

  - ☑ B [Ar] 3d¹ 4s¹
  - C [Ar] 3d<sup>0</sup> 4s<sup>1</sup>
  - ☑ D [Ar] 3d<sup>0</sup> 4s<sup>0</sup>

(Total for Question 7 = 1 mark)

**8** The shapes of the complexes  $[CrCl_4]^-$  and  $[Pt(NH_3)_2Cl_2]$  are

	_
X	A

**⊠** В

⊠ C

⊠ D

[CrCl <sub>4</sub> ]-	[Pt(NH <sub>3</sub> ) <sub>2</sub> Cl <sub>2</sub> ]
[CICI <sub>4</sub> ]

square planar	tetrahedral
tetrahedral	square planar

(Total for Question 8 = 1 mark)

**9** The compound 1,2-diaminoethane, H<sub>2</sub>NCH<sub>2</sub>CH<sub>2</sub>NH<sub>2</sub>, is a bidentate ligand; in formulae, it is usually abbreviated to 'en'.

When 1,2-diaminoethane is added to  $[Co(NH_3)_6]^{2+}$  in aqueous solution,  $[Co(en)_3]^{2+}$  is formed. What is the **best** explanation for this?

- $\blacksquare$  A There are much stronger bonds between the ligands and the cobalt(II) ion in  $[Co(en)_3]^{2+}$  than in  $[Co(NH_3)_6]^{2+}$ .
- **B** When  $[Co(en)_3]^{2+}$  is formed from  $[Co(NH_3)_6]^{2+}$  the reaction is exothermic.
- When  $[Co(en)_3]^{2+}$  is formed from  $[Co(NH_3)_6]^{2+}$  the total entropy change is positive.
- When [Co(en)<sub>3</sub>]<sup>2+</sup> is formed from [Co(NH<sub>3</sub>)<sub>6</sub>]<sup>2+</sup> the reaction has a low activation energy.

(Total for Question 9 = 1 mark)

- 10 When aqueous sodium hydroxide is added to an aqueous solution of a transition metal compound, a green precipitate is formed which dissolves in excess sodium hydroxide forming a green solution. The transition metal ion present in the original solution is
  - A Cr<sup>3+</sup>
  - B Fe<sup>3+</sup>

## **SECTION B**

# Answer ALL the questions. Write your answers in the spaces provided.

- **19** A compound **A**, known to contain only the elements carbon, hydrogen and oxygen, was subjected to detailed analysis.
  - (a) A sample of **A** was burned completely in the apparatus shown below. Solid **X** absorbed the water formed in the combustion and solid **Y** absorbed the carbon dioxide.

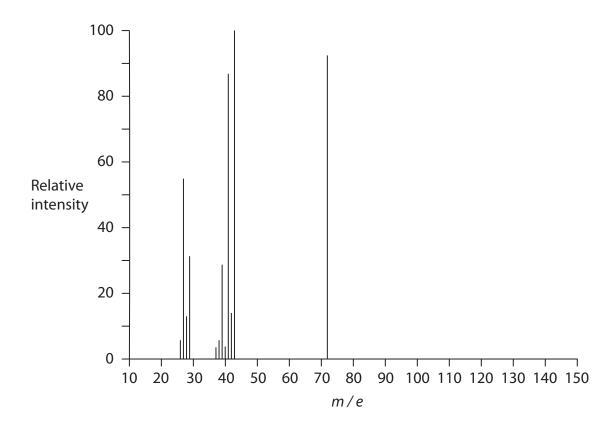

(i)	Explain why the oxygen must be dry.	(1)
(ii)	Suggest a suitable substance to use as solid <b>X</b> .	(1)
 (iii)	Suggest a suitable substance to use as solid <b>Y</b> .	(1)

(iv) 3.60 g of compound **A** was burned completely. The mass of solid **X** increased by 3.60 g and the mass of solid **Y** increased by 8.80 g.

Use these data to calculate the empirical formula of compound **A**. You **must** show your working.

(5)

(b) The mass spectrum of  ${\bf A}$  is shown below.

(i) Identify the molecular ion peak and hence deduce the molecular formula of **A**.

(2)

(ii) Given that <b>A</b> does <b>not</b> have a ring structure, suggest the <b>structural</b> formulae of three of the species that might cause the peak at $m/e = 43$ in the mass	
spectrum of <b>A</b> .	(3)
*(c) The low resolution nmr spectrum of $\bf A$ has three peaks in the ratio 6:1:1. Draw th	e
structure of <b>A</b> and show how your structure is consistent with the nmr data.	(3)
(Total for Question 19 = 16 m	arks)
· · ·	

20 Ibuprofen is a nonsteroidal anti-inflammatory drug (NSAID) widely used as an analgesic (pain reliever). It was discovered in the 1960s by the Boots Group which developed a six step synthesis from 2-methylpropylbenzene. The synthesis shown below was introduced in the 1990s by the BHC Company and received a Presidential Green Chemistry Challenge award in 1997. The citation noted that the synthesis has just three steps, all of which are catalytic, and an effective atom economy of 99%. Both syntheses are carried out in solution.

2-methylpropylbenzene

(a) (i) Suggest why a three step synthesis is likely to be 'greener' than a six step process.

(1)

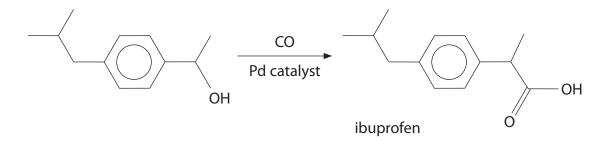

(ii) Why does the use of catalysts make processes 'greener' (as well as faster)?

(1)

The first step of the synthesis is an electrophilic substitution which is usually carried out in a school laboratory using ethanoyl chloride and an aluminium chloride catalyst.	
(i) Write an equation showing the formation of the electrophile in the <b>school</b> experiment.	(1)
(ii) Give the mechanism for the electrophilic substitution of 2-methylpropylbenzene by ethanoyl chloride, using the electrophile you have given in (b)(i).	(3)
(iii) Suggest <b>one</b> environmental benefit of using (CH <sub>3</sub> CO) <sub>2</sub> O, rather than ethanoyl chloride, in the manufacture of ibuprofen.	
	(1)

(c) The final stage of the modern synthesis for ibuprofen is shown below.

(i)	Suggest a benefit of using a <b>solid</b> catalyst in this reaction.	
		(1)

(ii) The preparation in part (c) can be carried out in a laboratory in three reactions.

(3)

**Reaction 1** 

**Reaction 2** 

**Reaction 3** 

$$CN$$
  $OH$ 

Give:

he reagents for <b>Reaction 1</b>

The reagents and conditions for **Reaction 3** 

(iii) Using your Data Booklet, explain how infrared spectroscopy can be used to
distinguish between the two structures shown below.

(2)

- (d) Ibuprofen is a chiral molecule and only one of its enantiomers is biologically active. However, although the synthesis produces a racemic mixture, an isomerase enzyme in the body converts the inactive enantiomer into the active enantiomer.
  - (i) Explain the term 'chiral molecule'.

(1)

(ii) Mark with an asterisk (\*) the chiral centre on the structure of ibuprofen below.

(1)

(iii) Explain the term 'racemic mixture'.	(1)
(iv) Suggest <b>two</b> benefits that arise from the isomerization of the inactive enantiomer of ibuprofen.	(2)
(Total for Question 20 = 18 i	marks)

(Total for Question 20 = 18 i	marks)

**21** (a) The following method was used to estimate the concentration of ethanol in an aqueous solution, **Q**, prepared by the fermentation of sucrose.

25 cm³ of **Q** was measured using a pipette and transferred to a 250 cm³ volumetric flask; the flask was made up to the mark with distilled water and mixed thoroughly, forming a diluted solution, **R**.

25 cm<sup>3</sup> samples of **R** were mixed with an equal volume of a 0.200 mol dm<sup>-3</sup> potassium dichromate(VI) solution and excess dilute sulfuric acid.

The mixture was allowed to stand for several hours and then the amount of unreacted potassium dichromate(VI) was determined by titration against a 0.255 mol dm<sup>-3</sup> iron(II) ammonium sulfate solution. The mean titre was 23.85 cm<sup>3</sup>.

(i) Use the ionic half-equations below to write the full ionic equation for the reaction between potassium dichromate(VI) and iron(II) ammonium sulfate.

State symbols are not required.

$$Fe^{3+} + e^{-} \rightarrow Fe^{2+}$$

$$Cr_{2}O_{7}^{2-} + 14H^{+} + 6e^{-} \rightarrow 2Cr^{3+} + 7H_{2}O$$
(1)

(ii) Calculate the number of moles of potassium dichromate(VI) that remained **unreacted** after standing for several hours with solution **R**.

(2)

(iii) Calculate the number of moles of potassium dichromate(VI) that reacted with the ethanol while standing for several hours with solution <b>R</b> .	(2)
(iv) Write an ionic half-equation for the oxidation of ethanol to ethanoic acid.  Use your equation, and the half-equation for the reduction of dichromate(VI) ions, to show that 3 mol of ethanol are oxidized by 2 mol of potassium dichromate(VI).	
	(2)
(v) Calculate the concentration of ethanol (in mol dm $^{-3}$ ) in solution ${\bf Q}$ .	(3)

# Answer ALL the questions. Write your answers in the spaces provided.

#### 22

## **Metal Complexes**

Complexes involve ligands forming dative covalent bonds with a central cation; the number of dative covalent bonds is the coordination number of the cation in the complex. Complexes may be positive, negative or neutral. The ligands may be neutral or negatively charged, but are never positively charged. The ligands must have a lone pair of electrons. In some complexes the central atom is neutral, as is the case with nickel carbonyl which is used in the Mond process for the purification of nickel:

$$Ni(s) + 4CO(g) \rightleftharpoons Ni(CO)_4(g)$$

The formation of complexes is typical of transition metals but other elements also form complexes. Zinc, which is a d block element but not a transition metal, and aluminium, which is a Group 3 element, both form complexes. Transition metal complexes are usually coloured, but if the interaction between the ligand and the central ion is very strong, then the resulting complex may well be colourless. This is the case with the complex  $[FeF_e]^{3-}$ .

The ligand in a complex affects its redox properties and this is apparent from considering the relevant standard electrode potentials. For example, with copper(II) species:

$$[Cu(H_2O)_6]^{2+}(aq) + 2e^- \rightleftharpoons Cu(s) + 6H_2O(l) \quad E^{-} = +0.34 \text{ V}$$

$$[Cu(H_2O)_2(NH_3)_4]^{2+}(aq) + 2e^- \rightleftharpoons Cu(s) + 2H_2O(l) + 4NH_3(aq)$$
  $E^{\oplus} = -0.05 \text{ V}$ 

Complexes are industrially important, for example in the purification of nickel mentioned above and in the extraction of gold which involves the complex  $[Au(CN)_{,}]^{-}$ .

Complex formation is used in estimating the concentrations of metal ions in solution. Examples of this are the use of EDTA in titration and dimethylglyoxime in gravimetric analysis. Complexes are also used in qualitative analysis, for example, in Tollens' reagent. This reagent is usually prepared by the addition of sodium hydroxide solution to an aqueous solution of silver nitrate followed by aqueous ammonia. The resulting solution contains diamminesilver(I) ions.

(b) Suggest how the aluminium ion is able to form dative covalent bonds in its	(2)

ion suddest now the authinium for is able to forth dailye covalent bonds in its	
complexes such as [AIF <sub>6</sub> ] <sup>3-</sup> .	(1)
(c) (i) Transition metal complexes are usually coloured. Explain how the colours	
occur.	(4)
(ii) Why are zinc complexes such as $[Zn(NH_3)_4]^{2+}$ colourless?	
(ii) Willy die Zille complexes sach as [Zil(Wig)4] Colodiness:	(1)

(iii) Suggest why the strong interactions between the F <sup>-</sup> ligands and Fe <sup>3+</sup> ion result in the complex [FeF <sub>6</sub> ] <sup>3-</sup> being colourless.	(2)
(d) Use the standard electrode potentials given in the passage to predict whether it is feasible for thiosulfate ions, S <sub>2</sub> O <sub>3</sub> <sup>2-</sup> , to reduce copper(II) ions to copper. Consider the case when the copper(II) ions are dissolved in water, and when they are dissolved in aqueous ammonia. Give chemical equations to support your answer.  The relevant redox reaction for thiosulfate ions is	(3)
$S_4O_6^{2-}(aq) + 2e^- \rightleftharpoons 2S_2O_3^{2-}(aq)  E^{\oplus} = +0.09 \text{ V}$	

(e) The proportion of nickel in nisil, an alloy of nickel and silicon used in thermocouples, may be determined by the following gravimetric analysis.

Finely ground nisil is dissolved in concentrated hydrochloric acid and, after neutralization, excess dimethylglyoxime dissolved in ethanol is added to the solution formed. The resulting red precipitate is filtered, washed, dried and weighed. The equation for the formation of the precipitate is

(i) State the coordination number of the nickel in the complex ion.

(1)

(ii) In an experiment, 1.02 g of nisil formed 4.82 g of the complex. Calculate the percentage by mass of nickel in the alloy. The molar mass of the complex is  $288.7 \text{ g mol}^{-1}$ .

(2)

(f) Suggest why the nickel carbonyl complex is used to purify nickel	l ores.
(g) Use the equilibria below to explain why ammonia is used to prepresent, as described in the passage.	oare Tollens'
