Instructions

- Use **black** ink or ball-point pen.
- If pencil is used for diagrams/sketches/graphs it must be dark (HB or B).
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
 - there may be more space than you need.

Information

- The total mark for this paper is 80.
- The marks for **each** question are shown in brackets
 - use this as a guide as to how much time to spend on each question.
- In the question marked with an asterisk (*), marks will be awarded for your ability to structure your answer logically, showing how the points that you make are related or follow on from each other where appropriate.
- A Periodic Table is printed on the back cover of this paper.

Advice

- Read each question carefully before you start to answer it.
- Show all your working in calculations and include units where appropriate.
- Try to answer every question.
- Check your answers if you have time at the end.

Turn over ▶

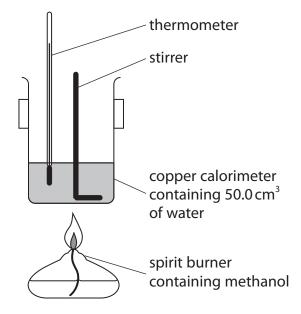

SECTION A

Answer ALL the questions in this section.

You should aim to spend no more than 20 minutes on this section.

For each question, select one answer from A to D and put a cross in the box \boxtimes . If you change your mind, put a line through the box \boxtimes and then mark your new answer with a cross \boxtimes .

1 A student measures the enthalpy change of combustion, $\Delta_c H$, of methanol, CH₃OH, using the apparatus shown.

After burning 0.20 g of methanol, the temperature of the water increases by 16.0 $^{\circ}\text{C}\,.$

(a) The measurement uncertainty in the thermometer used in the experiment is 0.5 °C for each reading.

What is the percentage uncertainty in the temperature change of 16.0 °C?

(1)

- **■ B** 3.1%
- **C** 6.3%
- **■ D** 12.5%

(b) The student repeats the experiment but burns 0.30 g of methanol and uses 75.0 cm³ of water in the copper calorimeter.

What is the expected temperature change in this repeat experiment?

(1)

- B 10.7°C
- **□** 36.0 °C
- (c) The student's calculated enthalpy change of combustion of methanol is **more** exothermic than a data book value.

What is a possible reason for this?

(1)

- A heat loss to the surroundings
- **B** incomplete combustion of methanol
- **C** evaporation of methanol from the wick of the spirit burner
- \square use of the molar mass of ethanol, C_2H_5OH , in the calculation

(Total for Question 1 = 3 marks)

- **2** Which equation represents the standard enthalpy change of atomisation, $\Delta_{at}H^{\oplus}$, of bromine?
 - \square **A** $\frac{1}{2}Br_2(I) \rightarrow Br(g)$
 - \square **B** $\frac{1}{2}Br_2(g) \rightarrow Br(g)$
 - \square **C** $Br_2(I) \rightarrow 2Br(g)$
 - \square **D** Br₂(g) \rightarrow 2Br(g)

(Total for Question 2 = 1 mark)

3 The enthalpy change of reaction, $\Delta_r H$, for the equation shown can be calculated using bond enthalpy data.

$$\frac{1}{2}H_2(g) + \frac{1}{2}CI_2(g) \rightarrow HCI(g)$$

Bond	Bond enthalpy/kJ mol ⁻¹		
н—н	436		
CI—CI	242		
H—CI	431		

The expression that should be used in the calculation is

$$\triangle$$
 A $(0.5 \times 436 + 0.5 \times 242) - 431$

$$\blacksquare$$
 B $(2 \times 431) - (436 + 242)$

$$\bigcirc$$
 C 431 - (0.5 × 436 + 0.5 × 242)

$$\square$$
 D (436 + 242) - (2 × 431)

(Total for Question 3 = 1 mark)

- **4** Which compound has London forces as the **only** intermolecular force?
 - A HF
 - \blacksquare **B** OF₂
 - C PF₃
 - \square **D** CF₄

(Total for Question 4 = 1 mark)

- **5** Which compound has intermolecular hydrogen bonding?
 - \triangle A (CH₃)₃N
 - \blacksquare **B** (CH₃)₃CF

 - □ (CH₃)₃CCHO

(Total for Question 5 = 1 mark)

- **6** Which sequence shows the hydrogen halides in order of **decreasing** boiling temperature?
 - \square A HF > HCl > HBr > HI
 - \square **B** HF > HI > HBr > HCl
 - \square C HI > HF > HCl > HBr
 - \square **D** HI > HBr > HCl > HF

(Total for Question 6 = 1 mark)

- 7 Which ion contains vanadium with an oxidation number of +4?
 - \triangle A VO^{2+}
 - \blacksquare **B** VO_2^+

 - \square **D** VO_4^{3-}

(Total for Question 7 = 1 mark)

- **8** What is the formula of potassium manganate(VI)?
 - A KMnO₄
 - \square **B** K₂MnO₄

 - \square **D** $K_6Mn_2O_6$

(Total for Question 8 = 1 mark)

- 9 Compound Q produces
 - a red colour in a flame test
 - a white precipitate when aqueous potassium sulfate is added to a solution of the compound.

What is compound **Q**?

- A LiCl
- B NaNO₃
- \square C Sr(NO₃)₂
- D BaCl₂

(Total for Question 9 = 1 mark)

- 10 Which reaction produces more than one product?
 - \square A Mg + O₂ -
 - \square **B** Ca + Cl₂ \rightarrow
 - \square **C** Sr + H₂O \rightarrow
 - \blacksquare **D** BaO + H₂O \rightarrow

(Total for Question 10 = 1 mark)

- **11** Which equation shows a redox reaction that would **not** be expected to occur, based on the trend in reactivity of the halogens?
 - \square **A** $I_2(aq)$ + $2At^-(aq)$ \rightarrow $At_2(aq)$ + $2I^-(aq)$
 - \square **B** $2Br^{-}(aq) + Cl_{2}(aq) \rightarrow 2Cl^{-}(aq) + Br_{2}(aq)$
 - \square **C** $Cl_2(aq) + 2I^-(aq) \rightarrow I_2(aq) + 2Cl^-(aq)$

(Total for Question 11 = 1 mark)

12 A fixed amount of concentrated H₂SO₄ is reacted separately with an excess of four solid potassium halides.

In which reaction would the greatest number of moles of halide be oxidised?

$$\square$$
 A 2KF(s) + H₂SO₄(aq) \rightarrow K₂SO₄(aq) + 2HF(g)

$$\blacksquare$$
 B KCI(s) + H₂SO₄(aq) \rightarrow KHSO₄(aq) + HCI(g)

$$\square$$
 D 8KI(s) + 9H₂SO₄(aq) \rightarrow 8KHSO₄(aq) + 4I₂(s) + H₂S(g) + 4H₂O(l)

(Total for Question 12 = 1 mark)

13 Silver nitrate in aqueous ethanol is added separately to four halogenoalkanes.

Which would form a silver halide precipitate in the **shortest** time?

- \triangle A (CH₃)₃CI
- \blacksquare **B** (CH₃)₃CCI
- C CH₃CH₂CH₂CH₂I
- ☑ D CH₃CH₂CH₂CH₂CI

(Total for Question 13 = 1 mark)

14 CH₃CH₂CHBrCH₂CH₃ is heated with ethanolic potassium hydroxide.

How many **alkene** products are possible?

- A one
- **B** two
- **C** three
- **D** four

(Total for Question 14 = 1 mark)

- **15** Which compound is **least** likely to have a prominent peak at m/z = 43 in its mass spectrum?
 - A CH₃COCH₂CH₃
 - B CH₃CH₂NHCH₃
 - C CH₃CH(CH₃)₂
 - □ CH₃CH₂CH₂CH₃

(Total for Question 15 = 1 mark)

- **16** Which compound has peaks at 3415 cm⁻¹ **and** 2250 cm⁻¹ in its infrared spectrum? Refer to the Data Booklet.
 - \square **A** H₂NCH₂CH₂C \Longrightarrow N
 - B CH₃CH₂CH₂COOH
 - \square **C** CICH₂CH₂C \equiv CH
 - D HOCH₂CH₂CH=CH₂

(Total for Question 16 = 1 mark)

17 The distribution of molecular energies for a sample of gas in a sealed container is shown.

(a) Why does the distribution of energies start at the origin, (0,0)?

(1)

- A some molecules have no energy
- **B** all molecules possess some energy
- C the temperature is 0 K
- D some molecules do not have enough energy to react
- (b) Some of the gas is removed and then the container is resealed and the gas is cooled.

How does the new distribution of molecular energies compare to the original sample?

(1)

	Area under the curve	Position of peak
A	does not change	shifts to the left
В	decreases	shifts to the left
C	does not change	shifts to the right
D	decreases	shifts to the right

(Total for Question 17 = 2 marks)

TOTAL FOR SECTION A = 20 MARKS

SECTION B

Answer ALL the questions. Write your answers in the spaces provided.

18 Calcium hypochlorite, $Ca(CIO)_2$, is used for water treatment in swimming pools. It is produced in the reaction between $Ca(OH)_2$ and CI_2 .

$$2 Ca(OH)_2(aq) \ + \ 2CI_2(g) \ \rightarrow \ Ca(CIO)_2(aq) \ + \ CaCI_2(aq) \ + \ 2H_2O(I)$$

(a) State the type of reaction occurring in the production of $Ca(CIO)_2$. Justify your answer using oxidation numbers.

(3)

(b) Calculate the percentage atom economy by mass for the production of Ca(CIO)₂ in this reaction.

(2)

- (c) A swimming pool has the dimensions $50\,\mathrm{m}\times25\,\mathrm{m}\times2.0\,\mathrm{m}$. The water in this swimming pool has a Ca(ClO) $_2$ concentration of $4.2\,\mathrm{mg}\,\mathrm{dm}^{-3}$.
 - (i) Calculate the mass, **in kg**, of Ca(ClO)₂ required to treat the water needed to completely fill this swimming pool.

(3)

(ii) Calculate the volume of Cl₂, at room temperature and pressure, needed to make the mass of Ca(ClO)₂ calculated in (c)(i).

(3)

(Total for Question 18 = 11 marks)

19 This question is about alcohols with the molecular formula $C_6H_{14}O$.

(a) Draw the **skeletal** formula of each of the three **tertiary** alcohols with the formula $C_6H_{14}O$.

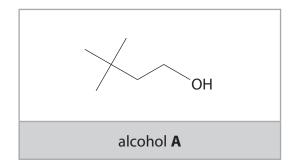

(3)

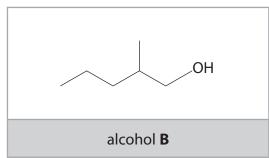

tertiary alcohol 1

tertiary alcohol 2

tertiary alcohol 3

(b) Two primary $C_6H_{14}O$ alcohols, \boldsymbol{A} and $\boldsymbol{B},$ are shown.

(i) Give the IUPAC name of alcohol A.

(1)

(ii) Explain why alcohol **B** has a higher boiling temperature than alcohol **A**.

(2)

(iii) Explain why alcohol **B** is completely soluble in ethanol but only slightly soluble in water.

A detailed description of the forces involved is **not** required.

(3)

(c) Give the structure of the **organic** product of each reaction shown.

(3)

Reaction 1

Reaction 2

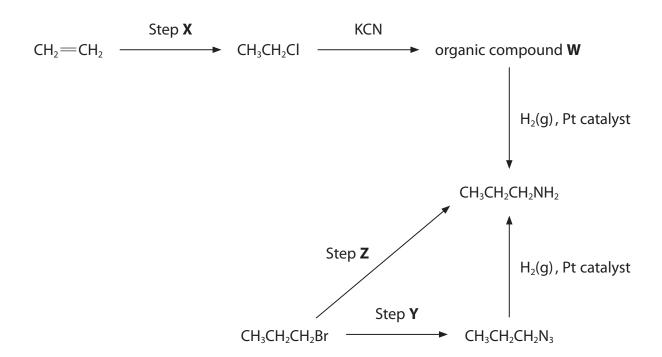

$$\begin{array}{c} & \qquad \qquad K_2Cr_2O_7, \, H_2SO_4 \\ \hline \\ OH & \qquad \qquad \\ & \qquad \qquad \\ \text{heat under reflux} \end{array}$$

Reaction 3

(Total for Question 19 = 12 marks)

20 This question is about the synthesis of propylamine, CH₃CH₂CH₂NH₂.

Three routes for the synthesis of CH₃CH₂CH₂NH₂ are shown.

(a) Identify, by name or formula, the reagent used in Step ${\bf X}$.

(1)

(b) Give the structure of organic compound $\boldsymbol{W}.$

(1)

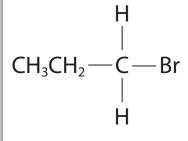

- (c) The reagent used in Step $\bf Y$ is potassium azide, KN_3 . This is a source of the azide ion, N_3^- , which acts as a nucleophile.
 - (i) Complete a possible dot-and-cross diagram for N_3^- . Show outer electrons only.

(2)

N N N

(ii) Complete the mechanism for Step Y.
Include curly arrows, and any relevant lone pairs and dipoles.

(3)

 N_3^-

(d) Step Z is carried out by reacting ammonia with 1-bromopropane.(i) Give the conditions for this reaction.	(2)
(ii) Suggest why the yield of $CH_3CH_2CH_2NH_2$ obtained using Step Z is low.	(1)
(Total for Question 20 = 10) marks)

Discuss some aspects of the thermal stability of the anhydrous nitrates of the elements in Groups 1 and 2 of the Periodic Table.	
In your answer you should	
 explain the trend in thermal stability of the Group 2 nitrates 	
 describe any differences in the products of thermal decomposition of the Group 1 nitrates 	
 give equations for the thermal decomposition of sodium nitrate and of magnesium nitrate.

SECTION C

Answer ALL the questions. Write your answers in the spaces provided.

- 22 Ammonium nitrate, NH_4NO_3 , is used in the manufacture of fertilisers and explosives. It is produced on a large scale using only methane, water and air. The process has four stages.
 - (a) The first two reactions in Stage 1 involve the production of hydrogen.

At temperature T_1 , methane reacts with excess steam to give hydrogen.

$$CH_4(g) + H_2O(g) \rightleftharpoons 3H_2(g) + CO(g)$$

$$\Delta H = +206 \,\mathrm{kJ} \,\mathrm{mol}^{-1}$$

At a different temperature, T_2 , the carbon monoxide reacts with more steam.

$$CO(g) + H_2O(g) \rightleftharpoons H_2(g) + CO_2(g)$$

$$\Delta H = -42 \,\mathrm{kJ} \,\mathrm{mol}^{-1}$$

(i) Give the reason why excess steam is used in the first reaction.

(1)

(ii) Predict which of T_1 and T_2 is the **higher** temperature. Justify your answer.

(1)

(iii) Derive the **overall** equation for the production of H_2 in Stage 1. State symbols are not required.

(1)

(b) The third reaction in Stage 1 involves the removal of carbon dioxide, using an aqueous solution of N-methyldiethanolamine, CH₃N(CH₂CH₂OH)₂.

$$CO_2(g) + H_2O(I) + 2CH_3N(CH_2CH_2OH)_2(aq) \Rightarrow (CH_3NH(CH_2CH_2OH)_2)_2CO_3(aq)$$

(i) Suggest **one** reason why CO₂ is removed.

(1)

(ii) Name the type of reaction occurring.

(1)

(iii) Draw the **displayed** formula of N-methyldiethanolamine, CH₃N(CH₂CH₂OH)₂.

(1)

- (c) In Stage 2, the hydrogen from Stage 1 reacts with nitrogen (from the air) to produce ammonia. The conditions for this reaction are:
 - a temperature of 700 K
 - a pressure in the range 100-200 atm
 - an iron catalyst

$$N_2(g) + 3H_2(g) \rightleftharpoons 2NH_3(g)$$
 $\Delta H = -92 \text{ kJ mol}^{-1}$

$$\Delta H = -92 \,\mathrm{kJ} \,\mathrm{mol}^{-1}$$

Give one advantage and one disadvantage of using a pressure of 200 atm, compared to a pressure of 100 atm, in Stage 2.

(2)

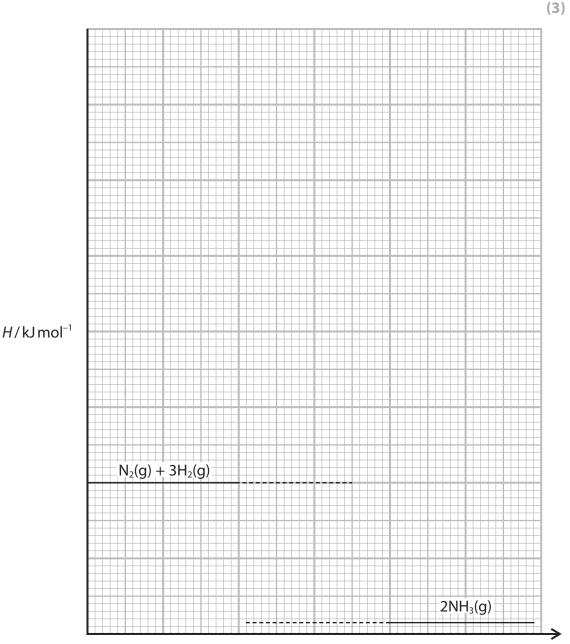

(d) The reaction in Stage **2** has an activation energy, $E_{cat} = +70 \text{ kJ mol}^{-1}$.

The **uncatalysed** reaction between N_2 and H_2 has an activation energy, $E_a = +290 \, \text{kJ} \, \text{mol}^{-1}$.

(i) Complete the profile for the catalysed and uncatalysed reactions. Label the activation energies and the enthalpy change of reaction, ΔH .

Your diagram must match the scale shown for the production of NH₃.

Reaction progress

(ii) Suggest why the use of the catalyst makes Stage ${\bf 2}$ more sustainable.

.....

(1)

(e) In Stage **3**, nitrogen monoxide, NO, is produced in the reaction between NH_3 (from Stage **2**) and O_2 (from the air). The conditions used are a temperature of 1100 K in the presence of a platinum-rhodium catalyst.

$$4NH_3(g) + 5O_2(g) \rightleftharpoons 4NO(g) + 6H_2O(g)$$
 $\Delta H = -905 \text{ kJ mol}^{-1}$

(i) Give **one** reason why a high temperature is needed in this reaction.

(1)

(ii) Suggest why only a small amount of energy is used to maintain the temperature at 1100 K.

(1)

(f) The NO from the first reaction in Stage $\bf 3$ is cooled and then converted to nitrogen dioxide, NO₂, by reaction with more O₂.

$$2NO(g) + O_2(g) \rightleftharpoons 2NO_2(g)$$

Nitric acid, HNO₃(aq), is produced by the addition of water.

$$3NO_2(g) + H_2O(I) \rightarrow 2HNO_3(aq) + NO(g)$$

Explain how adding water in the second reaction affects the yield of NO₂ in the first reaction.

(2)

(g) In Stage **4**, a solution of NH₄NO₃ is produced by reacting NH₃ (from Stage **2**) with HNO₃ (from Stage **3**).

$$NH_3(g) + HNO_3(aq) \rightarrow NH_4NO_3(aq)$$

Data

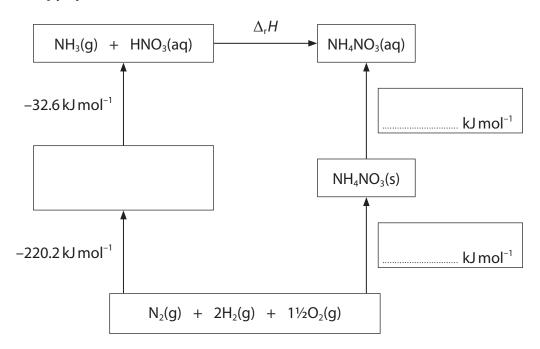

Species	NH₃(g)	HNO ₃ (I)	NH ₄ NO ₃ (s)
$\Delta_{\rm f} H^{\Theta} / {\rm kJ mol^{-1}}$	-46.1	-174.1	-365.6

Equation	$\Delta H/\text{kJ}\text{mol}^{-1}$
$HNO_3(I) + aq \rightarrow HNO_3(aq)$	-32.6
$NH_4NO_3(s) + aq \rightarrow NH_4NO_3(aq)$	+25.6

(i) Complete the enthalpy cycle.

(2)

Enthalpy cycle

(ii) Calculate the enthalpy change, $\Delta_r H$, in kJ mol⁻¹, for the reaction of NH₃(g) with HNO₃(aq).

(1)

a	tuggest two reasons why it is more profitable to carry out all four stages at the same site, instead of using different sites for each stage in the	
"	ndustrial production of ammonium nitrate.	(2)
