Please check the examination deta	ils bel	ow before ente	ring your candidate information
Candidate surname			Other names
Pearson Edexcel International Advanced Level	Cen	itre Number	Candidate Number
Time 1 hour and 20 minutes		Paper reference	WBI13/01
Biology			<b>A A</b>
International Advance UNIT 3: Practical Skills		-	
You must have:			Total Marks

### **Instructions**

- Use **black** ink or ball-point pen.
- **Fill in the boxes** at the top of this page with your name, centre number and candidate number.
- Answer all questions.
- Answer the questions in the spaces provided
  - there may be more space than you need.
- Show all your working in calculations and include units where appropriate.

#### Information

- The total mark for this paper is 50.
- The marks for **each** question are shown in brackets
  - use this as a guide as to how much time to spend on each question.

### **Advice**

- Read each question carefully before you start to answer it.
- Try to answer every question.
- Check your answers if you have time at the end.
- Good luck with your examination.

# **BLANK PAGE**

	Write your answers in the spaces provided.	
1	Some plant extracts have been shown to have antimicrobial properties.	
	(a) Describe a method that can be used to study the antimicrobial properties of a plant extract.	
	plant extract.	(5)

(b) The antimicrobial properties of extracts from four species of plant (A, B, C and D) were investigated using three types of bacteria.

The antimicrobial effect was scored on a scale of 0 to 3, where 0 is no effect and 3 is a very large effect.

The table shows the results of this investigation.

Turns of bactoria	Score for each species of plant										
Type of bacteria	A	В	С	D							
B. subtilis	1	3	0	2							
P. vulgaris	0	2	0	1							
S. aureus	2	3	2	3							

The results were plotted as a bar chart.

(i) Complete the bar chart by labelling the axes and key, using the information in the table.

(3)

(ii) Evaluate the antimicrobial effects of these ex	tracts.
Use the data to support your answer.	(4)
	(Total for Question 1 = 12 marks)

2		ring plants produce seeds that can be stored in a seed bank. This is done to eve the biodiversity of plants.	
	(a) (i)	Describe how seeds are treated and then stored in a seed bank.	(3)
	(ii)	State what is meant by the term <b>biodiversity</b> .	(2)

(b) The longer seeds are stored in seed banks, the less likely they are to germinate. This is due to ageing.	
Ageing of seeds can affect the growth of roots when the seeds germinate.	
Determining the mitotic index of roots is one way to study growth of roots.	
(i) Describe how the mitotic index of roots can be determined.	
	(4)

(ii) Seeds can be treated to artificially age them.

In an investigation, untreated and treated samples of seeds were germinated and the roots allowed to grow.

Roots of different lengths from the untreated seeds, seeds treated for 4 days and seeds treated for 14 days were selected.

The mitotic index of these roots was determined.

The graph shows the results of this investigation.

There were 14 cells undergoing mitosis in 8 mm roots from seeds treated for 4 days.

Calculate the total number of cells that were counted when the mitotic index was determined.

(3)

Total cells counted .....

(iii) Draw a table to show the data on the effect of root length on mitotic index in seeds treated for 14 days.

(3)

(iv) Identify the conclusions that can be drawn from these	data.	(3)
(v) The graph does not show the standard deviations of t	he means for mit	otic index.
Describe how the investigation could be modified to		
(v) The graph does not show the standard deviations of t Describe how the investigation could be modified to a to be obtained.		
Describe how the investigation could be modified to		eviations
Describe how the investigation could be modified to		eviations
Describe how the investigation could be modified to		eviations
Describe how the investigation could be modified to		eviations
Describe how the investigation could be modified to		eviations
Describe how the investigation could be modified to		eviations
Describe how the investigation could be modified to		eviations

Pollen grains germinate in a solution that contains sucrose and bori	ic acid.
The effect of boric acid concentration on the percentage germination was studied.	on of pollen grains
(a) State the dependent variable in this study.	(1)
(b) In this study, the solutions used were maintained at pH 6.	
Explain why this pH was maintained.	(2)

(c) The graph shows the results of this study.

(i) Draw a graph to show how boric acid concentration affects germination at 4 hours.

Join the points with straight lines.

(5)

(ii) Describe the effect of boric acid concentration on pollen grain germination at 4 hours.

(2)

 	 •	 											

(d) In another study, the effect of boric acid concentration on pollen tube growth was investigated.

The graph shows the results of this study.

(i) During the first two hours, the rate of pollen tube growth at a boric acid concentration of  $100\,\text{mg}\,\text{dm}^{-3}$  is  $130.5\,\mu\text{m}$  hour<sup>-1</sup>.

Calculate the percentage increase in the rate of pollen tube growth between the rate at  $0 \, \text{mg} \, \text{dm}^{-3}$  and the rate at  $100 \, \text{mg} \, \text{dm}^{-3}$ , during the first two hours.

(2)

You are provided with a 500 mg dm <sup>-3</sup> boric acid solution.  (4)  Compare and contrast the effect of boric acid concentration on pollen grain germination with its effect on pollen tube growth.  Use the information given in this question.  (2)	
Compare and contrast the effect of boric acid concentration on pollen grain germination with its effect on pollen tube growth.  Use the information given in this question.
